

Mammotome® Breast Biopsy System

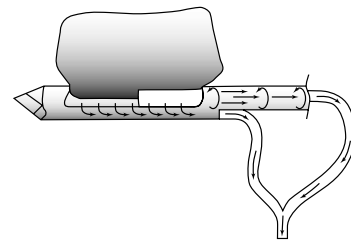

Benefits

- Helps doctors accurately diagnose early stage breast cancer, if present
- Single incision is so small, no stitches are required
- Outpatient procedure takes less than an hour
- Women can resume normal activity immediately following procedure
- Minimizes internal scarring that may interfere with follow-up mammogram

How It Works

- Woman lies comfortably on her back or facedown on a special table
- Mammotome is inserted once into a 1/4 inch incision in the breast
- The vacuum draws tissue into sample chamber while cutter is advanced, capturing sample. Sequence is repeated until the area of concern is thoroughly biopsied

- A small adhesive bandage covers the incision site
